

Javadoc

Javadoc overview

- Javadoc is a documentation generator utility that parses declarations and specially formatted source code comments to build comprehensive API references in an HTML format
- For each item, begin with a short summary
- Common Javadoc tags include the following:
 - `@param` name description – describes method/constructor parameter
 - `@return` description – describes the return value
 - `@throws` ExceptionType description – describes an exception the method may throw
- Additional tags: `@author`, `@version`, and more
- Documentation: <https://docs.oracle.com/javase/8/docs/technotes/tools/windows/javadoc.html>

Automating and exporting Javadoc

- We will use the Javadoc Tools for VS Code extension*
 - Allows you to Generate Javadoc for workspace or open file
 - Can export Javadoc (only works with a package structure)
- Command to generate Javadoc:
 - `javadoc -d docs src/*.java`
 - docs is directory to store documentation
 - src is directory containing *.java files
