

Annotated Github Repository

- Current branch
- Click to change

- Shortened Unique ID of the most recent commit
- Click to view commit

Click for *git clone* URL

The screenshot shows the GitHub interface for the 'CoursePlanningTool' repository. Annotations with arrows point to various elements:

- Repository:** Points to the repository name 'CoursePlanningTool' and the 'Public' badge.
- Current branch:** Points to the 'dev' branch selector.
- Click to change:** Points to the dropdown arrow next to the 'dev' branch selector.
- Shortened Unique ID of the most recent commit:** Points to the commit hash 'e0403f5'.
- Click to view commit:** Points to the commit hash 'e0403f5'.
- Click for *git clone* URL:** Points to the 'Code' button.
- Author of last commit:** Points to the user 'gdancik'.
- Commit message:** Points to the message 'Merge pull request #125 from awindrow/Error-Messages'.
- Click for history of commits:** Points to the '963 Commits' link.

The image is a screenshot of a GitHub commit history page. At the top, there's a header 'History of commits'. Below it, a branch selector shows 'dev' with a dropdown arrow. A blue arrow points to this selector with the text 'Branch (click to change)'. The commit history is grouped by date: 'Commits on Sep 2, 2026', 'Commits on Aug 18, 2026', and 'Commits on Aug 11, 2026'. The first group contains two merge commits. The second group contains one commit titled 'Finished Adding Testing'. To the right of the commit messages, there are three commit hashes: 'e0403f5', '7170e9d', and '9747bf2'. Each hash is preceded by a green 'Verified' badge. Blue arrows point from the text 'Commit messages' to the commit titles. Another set of blue arrows points from the text 'Click to view commit details' to the commit hashes. A bulleted list on the right side of the image explains that the hashes are 'Shortened Unique ID of the commit' and that clicking them leads to 'view commit details'.

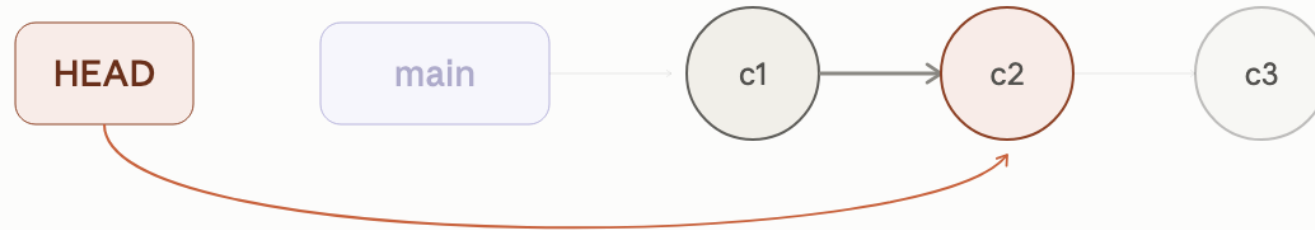

Normal and Detached HEAD states

Normal state

Detached HEAD state

after: `git checkout c2`

HEAD points straight at c2 — no branch holds this position.
New commits here can be lost once you switch away, unless
you create a branch first: `git switch -c new-branch`

Common git commands

Command	Description
git status	Shows the current state of the working directory — which files are staged, modified, or untracked.
git log	Displays the commit history for the current branch.
git add filename	Stages changes to a file, preparing it to be included in the next commit.
git restore file	Discards uncommitted changes to a file, reverting it to the last committed version.
git restore --source= hash file	Restores a file to its state at a specific commit (hash), rather than the most recent one.
git commit -m "comment"	Saves staged changes as a new commit, with "comment" as the commit message.
git push	Uploads local commits to the remote repository.
git branch	Lists existing branches (or creates a new one if given a name, e.g. <i>git branch name</i>).
git switch -c branch	Creates a new branch and switches to it in one step (omit the -c if the branch exists)
git checkout hash	Moves the working directory to a specific commit (identified by its hash), often resulting in a "detached HEAD" state.
